Javascript check android or ios

I found this feature in StackoverFlow and I think it's brilliant. This function controls if window.orientation exists, because desktop and laptop computers do not usually return true to mobile devices. I used it in different projects and could say that it works like a charm. However you must take into account that perhaps it is not 100% reliable and some devices could give "false" (I have not found any problems yet). ISMOBILEDOWNICE FUNCTION () {RETURN (TypeOF Window.orientation! == "undefined") || (Navigator.userAgent.indexOf ('IMOBILE') == -1); } ;; I tested this function with good results in Windows 7 and Mac OS X browsers (Chrome, Firefox, Safari, IE9 / 10), Android 4, Windows Phone 8 and iOS 6. If you want to test a device to enter this page: In the event that the device is not supported, add a comment and we will try to resolve the problem and update the function. List of tested and confirmed devices: safari, chrome, firefox and IE10 of windows 7/8 browser safari ios chrome ios opera coast ios of the Android stock browser chrome for Android Firefox for Android operates for Android Dolphin for Android IE Windows Phone 7.8 e Windows Phone 8 I noticed that two of my blog posts continue to become even more popular every week: an iPad detection with JavaScript or PHP and iPhone and iPad with JavaScript or PHP detection. What is obvious is that Android development is a hot topic that can only grow. Á, here are some methods with which it is possible to detect the main competitor iOS: Á, Android. The JavaScript searches for "Android" is the fastest way: var = ua navigator.userAgent.toLowerCase (); Var Isandroid = UA.indexOf ("Android")> -1; // && ua.indexOf ("mobile"); If (Isandroid) { // do something! // redirect to Android-site? window.location = ' '; } The php also in this case, we will use the PHP STRSTR function to search for Android in the user program: \$ ua = strtolower (\$ _server ['http_user_agent!']); IF (!! Strips (\$ ua, 'Android') == false) { // && strips (\$ ua, 'mobile') == false} {header ('location '); Exit(); } Bonus! Á, htaccess detection We can also use the .htaccess directives to detect and react to Android devices! ... rewritecond% {http_user_agent} ^ * Android * \$ rewriteRule ^ \$ {r = 301} and the game is made (*). Á, three different Android device detection! Á, have fun with your cellular development! His first CSS books helped push my love for front-end technologies. What was there in CSS that you fell in love with and pushed you to write about it? At first glance, it was the simplicity of it compared to the table-spacer ... Before starting, it's worth spending a brief moment to introduce me to you. My name is Mark (or @integrallist if Twitter seems to be your choice communication tool) and I currently work for BBC News in London England as the main engineer / tech ... and 'best practice to provide an indicator of some kind During the execution request of an Ajax or transformation that takes place in the background. From the Ajax albores, we used colored spinners and images as indicators. While I enjoy those images, I am ... an interesting Pseudo CSS selector: target. Á, the pseudo destination selector provides styling functionality for an element whose ID matches the window position. Á, we give a quick look at how the CSS target works Pseudo selector! The HTML code is suppose there are a number of HTML elements with ... This QuickStart shows how to add Google Analytics for your app and start recording events. Google Analytics collects the data of use and For your application. The SDK recorded two main types of information: Events: what is happening in your application, such as user actions, system events or errors. Property User: Attributes that define to describe segments of the user base, such as language preference or geographical location. Analytics automatically record some event events User proprietary: It is not necessary to add any code to enable them. Before starting if you don't already do it, add firebase to your JavaScript project and make sure that Google Analytics is enabled in your Firebase project: if you are creating a new Firebase project, enable Google Analytics during the workflow of the project creation. If you use an existing Firebase project that has not enabled Google Analytics, go to the settings tab> Project settings to enable it. Note: Firebase projects created before July 31, 2019 can update the complete Google Analytics experience for free from the settings integrations tab> Project settings. This update is optional but recommended. When you enable Google Analytics in your project, Firebase web apps are linked to Google Analytics data flows associated with an app + web property. Add the Analytics SDK to your app depending on how your web application is hosted, the configuration could be managed automatically or you may need to update your Firebase configuration object. If your web app you use Google Analytics already, you may need to perform an additional setting described in using Firebase with existing Gtag.js tagging. Verify that your configbase config object in your code contains fit. This ID is automatically created when you enable Analytics in the Firebase project and records a Web app, and you need to use Analytics. Note: For the Apps using the JavaScript SDK V7.20.0 and subsequent Firebase, Firebase dynamically retrieves the measurement when your App initializes the analysis. Having this ID in the Config object is optional, but serves as a fallback in the rare case that dynamic recovery fails. If your app uses Firebase Hosting and Use Reserved URLs for SDKS Firebase: Firebase automatically manages the application configuration. To complete the configuration, add the scripts from the apps card to the project settings to the tag of your app, if you don't already do it. If your app does not use reserved URLs: if you are working with an existing web app, update the configbase config object in your code to make sure the measurement range is present. The config object should seem similar to the following example: // for Firebase JavaScript SDK V7.20.0 and later. Misemementid is an optional field Const FirebaseConfig = {apikey: "AizasyCG00PSPWFJKUSXBHOPKH0XD4MX245VDC ", Authomain: "Project-id.firebaseio.com ", DatabaseTuri: " ", ProjectID: "Project-id ", StorageBucket: "Project-id.Appspot.com ", MessagingingenderD: "637908496727 ", AppID: "2 ", 637908496727, Web: A4284B4C99E329D5 ", Measure: "G-9VP01NTSXJ "}; Initialize Analytics Firebase: More information on the Shakiabie Shatiabie Web V9 SDK modular and Update version 8. Import {Getanalytics} from "Firebase / Analytics"; CONST ANALYTICS = Getanalytics (); CONST ANALYTICS = FIREBASE.Analytics (); If you have previously had Google Analytics running in your app using the gtag.js snippet, your app may request an additional installation if you plan to do one of the following: add Google Analytics calls from Firebase to the page, but It also plans to continue using GTAG () call directly on the same page. You want to use the same measurement ID between Calls both Direct GTAG () and Google Analytics data sent to Firebase. To ensure that your events are available for use by all Firebase services, complete the following additional configuration steps: Remove the GTAG line ('config Á »,' ga_measurement id '); Where ga_measurement id is the measurement of your web firebase app. If you have others For other analytics properties on the page, you don't need to remove their configuration line. Make sure you call Firebase.Analytics () Before sending events with GTAG (). Otherwise, events sent to that ID with GTAG calls () will not be associated with Firebase and will not be available for targeting in other Firebase services. Start registration events after initializing the Analytics service, you can start recording events with the IL method. Some events are recommended for all apps; Others are recommended for specific types of business or vertical. You should send suggested events together with their prescribed parameters, to ensure maximum details available in reports and to benefit from functionality and future additions as they become available. This section demonstrates the registration of a predefined event, for more information on registration events, see the log events. The following example shows how to register a recommended event to indicate that a user has received a notification in your app: more information about the Shakiabie Web V9 SDK modular shaft and version 8. Import {Getanalytics, Logevent} from "Firebase / Analytics "; CONST ANALYTICS = Getanalytics (); Logevent (Analytics, 'Notification Received'); Firebase.Analytics (). Logevent ('notification received'); Except that otherwise noted, the content of this page is licensed under the Creative Commons Attribution 4.0 license, and the code samples are licensed with the Apache 2.0 license.
