## Can t add apps to home screen android

How to add apps to home screen android. Why can't i add apps to my home screen. Do not add apps to home screen android. Can't add apps to home screen android.

Android lets you add a lot of things to your home screens - widgets, shortcuts, folders, apps ... so much that the organization of everything can be overwhelming. Here are some suggestions to optimize your Android's home screen for maximum productivity. The phone is different. You may have a Motorola Droid with only a version of Vanilla three at the home of Android, or you may have a HTC phone with seven screens, a ton of extra widgets and other UI improvements. Regardless of your situation, though, there are a number of things you can do to keep the home screen organized, so you can spend less time to launch them and more time using your phone. Produced a new first and best Launcherone home screen the things you can do is obtain a different domestic screen launcher. The default is fine, but there are some options there off that provide a ton of useful options that can help you customize your screen based on your workflow.My Personal Favorite is LauncherPro, available for free in the market (also If there is a \$ 2.99 version that is supplied with some good-looking widgets) and set it as a default launcher by selecting "Use default for this action" when you first take the Home button. A clean-looking, considerably fast, and comes with a nice sliding pier at the bottom where you can put the apps really used. I also find this useful for "wood-burning" switches, such as switching Google Voice on and off or visit the SmartBar QuickBar window previously mentioned (higher on a second time) .android: there are many popular utilities for Android, from task killers , Switchers of the app and ... Contact Morafert installing LauncherPro, you can access a series of new settings related to the home screen, going to the Home screen, hitting the menu button on the phone and touch preferences. You will only have to hit; Many of them are performances and appearance-based, giving the dock new looks or icons, but there is one in particular that everyone should take a look. The second option down is HomeScreen settings, where you can choose the number of screens you have. You can choose a number from one to seven, and also choose which one of those is your default screen (you want to be that in the middle, probably ... that is, if you have seven screens, you will want the default value to be the number of four screen). How many domestic screens should I have? It seems that there are two general philosophies in organizing its main screen: some people love to have as many screens as possible, with a ton of apps, shortcuts, and widgets filling them. Others love to have only some screens with the most important apps easily accessible and others close in folders or other app launchers. Here are some strategies you can use for each method, starting from those of you who like lots of screens. A lot of home screens your shortcuts for overview: using a lot of domestic screens give you all kinds of options to organize things, but it can also cause a lot of scroll. Fortunately you don't need to slide constantly through everyone to get to an app or a shortcut. If you are using Learercherpro, you will notice that touching the Home button once already on an home screen will give you an overview of all the screens. You can then touch one of them to go straight there. This makes the seven screens less than a wasted weight. Note that even other launchers can have this ability, even if sometimes they are in different places - often by pressing the app drawer icon or by pressing the points next to it that correspond to the home screens will make you one similar. Categorize for screen: Now, this can seem obvious to some, but one of the best advice I can give you for the use of all those screens is to organize them by category. For example, I have my default screen that has some of my most used apps like Gmail, Google Talk and Facebook, but my others are organized by music, productivity, games, social networking, etc. For example, my music page has a one Musical widget to change track, as well as shortcuts for Last.fm, Pandora and Apps. It makes it easier to know where you have to go and access a specific app. Do not underestimate the power of the widgets: if your phone can manage the slight performance stroke sometimes incorporates (I found that Launcherpro is still quickly my Motorola droid with seven domestic screens and lots of big widgets), they are really convenient. You can view a lot of information from a specific app without even opening it. For example, to see my list of things to do, I can simply slide a screen to the left; I don't even need to open my app to do. Likewise, I can read Facebook and Twitter without waiting for apps to simply scroll through widgets. It's a nice time saving when you just want to do a fast drive and you don't need to do a serious job with the app in question. To add a widget, just press you for a long time on any empty space on the domestic screen and choose "Widget" from the menu. You will get a list of all available widgets and you can select one to put it on the main screen. You can also drag them where you just like by pressing the widget for a long time, just as you would like a shortcut of app.usando a fewer domestic screens that you prefer only a few domestic screens, obviously want your most important and most used apps, then Put those on the main screen first of all. If you have any advanced rooms, you can launch a widget or two on the screen, or add folders, which saves you the scroll problem through the app drawer when you need a slightly less common app. Organize these folders just like you would like to home Screensed by Category: Throw your music apps in a folder, the productivity apps in another and so via add a folder, press a blank space on the main screen and choose "Folders "From the menu. You have some presets to choose from, but if you just want a custom folder with some shortcuts in it, choose the upper option. Then he simply drags your apps to the top of the folder icon, just as you would do on a computer. To rename the folder, open it and press a long time on its title bar. For quick access to other apps, there is a convenient functionality in Android where if you have long pressed the Home button on your phone, you will give you a list of recent used apps. This can be practical for switching the fast app, especially if you don't have many shortcuts directly on the main screen. You can also organize the apps using labels instead of folders (family sound, Gmail users?) Using an app called Apps App organizer, available on the market. Shortcuts, shortcuts, shortcuts from shortcutsapp are always useful, but the ordered thing Android is there a lot of other types of shortcuts that you can add to an home screen. You can add a link to one of your browser bookmarks (so you can have quick access to, for example, Google Reader or your favorite technological blog), shortcuts for browsing to a specific address (so you can always go home With the touch of a button) or specific contacts (so you can call some friends with two faucets instead of scrolling the contact list each time). These are enormous time savers, and after adding them to your home screen you will ask you why I never lived without them. To add a link, press a long time on an empty space of the domestic screen and choose "Shortcuts" from the menu. Depending on the app installed on your phone, you will have a number of choices, then look through the list and you will see what they could benefit from you and your workfow Which make life easier there are many other apps outside can improve this experience, but there are some who have made my life particularly easy, You mentioned earlier Power Strip, which allows you to access widgets, apps and other shortcuts without you even to leave the screen on which you are. It is quite useful to activate some features or change your music track without leaving your work application. Only: While Android has some some Tricks Built-in, Power Strip Re-assigns your MORETHE / LEADER Other is already mentioned SmartBar. This app has a lot of features (if you love the killer tasks, this app will make your life much easier), but my favorite is the function of quick settings that is essentially a more advanced version of the control widget power. You can activate and deactivate things like Wi-Fi, GPS, home screen rotation, and even your unlocking model. It is quite useful to have around, and does not take any space on the home screen if you don't want it (unlike other apps, you can insert it in the menu bar if you prefer ... I like it in Launcherpro's dock). Obviously, these are not all the suggestions and apps there off that make it easier to use the phone, but it's a good start, and there should be something here for everyone. Of course, not all suggestions above apply necessarily for you "feel free to try them out, then mix and match based on the workflow and how to use the phone. And, of course, feel free to share your advice with We and your companions readers in the comments. The widgets have been around for a long time. It was one of the features that made Android better than IOS. These days, our dependence on the widgets has decreased. between apps best, quick settings, quick settings , App shortcuts, more powerful notifications and always-on views, there are not too many reasons to make them. However, there are only some things, how to take note, time, calendar, lists of things to do, etc. that will work better in a widget format. Simply didn't lived in the era we did once, but this doesn't mean that widgets mean are useless now. Here are the best Android widgets! Iweather is probably One of the best weather apps available. Its Android widgets are not even harm. Invoke the old style À é à - À "Tip clock and weather" style that used to adorn HTC senses and is configurable. Clicking on the clock portion takes you to your Alarm App. By clicking on the weather portion port to the main Iweather interface. There are also only meteorological widgets that offer good quantity of information. Free to use. The entire paid version is to remove ads. AccuWeather is another good weather app with a decent widget if you're doing it for you. The reborn battery widget among the best Android widgets for battery counters. It provides a single widget for circular batteries. You can change the color and size to match the theme and layout of the home screen. The app is also provided with information on the battery, shortcuts to things like wifi and bluetooth settings, and you also give you graphic to show a more detailed battery activity. It's nothing too complicated. However, in an era in which smartphone manufacturers are not always allowed to enable the percentage in the status bar, the apps as the rebate battery widget are still useful. The Home Agenda widget calendar is an excellent calendar widget for your mobile phone. You can fear the widgets at your leisure. There is an option to download and install themes from other people. Some other options include a meteorological function, hiding various events, hiding the refused events and even changing the colors of certain calendar labels. It works best with Google Calendar. Recent updates have also added the best performance improvements. The app is performed for \$ 1.99 but has no additional advertising or in-app purchases. Price: free / up to \$ 3.49 Widget calendar: month and agenda are two Android widgets from Candl Apps. The first is a fairly standard and minimal calendar widget. Includes over 90 themes, a minimum layout, support for Calendar and shows your various imminent commitments. It seems and feels pretty good, even if power users may need something a little more powerful. Widget Calendar: Agenda is very similar to the other calendar widget app, but with more options. You can create widgets specifically for your program and any other imminent event you may have. Both widgets are free with Limited number of themes. You can buy more as in-app purchases. Price: free / \$ 2.99 Chronus Information widget is a set of fairly decent widgets for the home screen. It mainly includes clock and weather widget with some news widgets and also other things. Most widgets are pretty customizable and can work with most domestic screens. There is also a support of the operating system if you need it. The PRO version adds some small extras like support and support for Google Fit for reddit in news widgets. It is a repairable option that should work well for most people. Google Keep Notes is a simple and effective note that takes the application. With it, you can make text notes, list notes and even vocal notes. It also gives you the possibility of sharing notes with others for collaboration. There are also lots of small features hidden throughout the app. It also comes with a simple set of Android widgets that gives you the possibility of creating notes quickly. They extend in size from simple to overall depending on your needs. This is essentially everything you need when you arrive the widgets for the note to take app. It is completely free to use. You can also access Google Drive notes using any Web browser. Joe Hindy / Android AuthoraPtt is one of the most powerful apps outside. You use it to create automated activity that the phone complete alone. One of its numerous functionality is a button widget that activates a command when pressed. For example, you can use it to turn on or off the tonal lights, automatically send a message to someone you are going to go home, or practically what you want. There is a bit of a learning curve, but it's a fun way to automate many boring tasks. The widget itself is quite simple. However, it is easily one of the most versatile Android widgets outside. KWGT is one of the two Android-Your-Yourself widgets. It uses a WYSIWYG editor. This makes it a little easier than it would think about it. You can make it make a variety of things and make it look almost like you want. It also includes support for zipper, tasker and other apps. Some of the things you can have to display include system information (CPU speed, network statistics, etc.), time, battery, date, contamination, traffic information, subsequent alarm, position and more. It's powerful enough, but it's more a job more than you arrive with most widgets. À, for our knowledge, one of the very few personalized widgets still in active development. Zooper is another option, but fails more updates. The Buzz widget is no longer available starting from February 2019. What basically leaves Kwgt and kill as the best dogs. This app is also free via Google Play Pass if you use it. Ovedrop is one of the new Android widgets in the list. It is technically technically only a weather app, but has some surprisingly decent widgets for the home screen. This includes a forecast widget with a maximum of five days, a paper style layout that includes the date and percentage of the battery and your basic current weather forecast widget. Use the dark sky like its meteorological provider and also has some functionalities of application of the basic time. The app itself has a dark mode that we like and the UI is adorable. There isn't much wrong with this to be honest, and it's a great option if you want some good-looking weather widgets. Joe Hindy / Android Authority Authority is one of the most powerful apps ever made. It is also one of the most complex and complicated. You can use it to make your phone practically what you want. The negative side is that you will take you some time to get there. Over 200 actions alone with tons of plugins that add additional functionality. A lot of other apps also have tasker support to add to the number of things that can do. Once you do everything you are going, it won't take much from there to turn it into a widget. This makes this more powerful Android widgets you can get. This is also free with Google Play Pass if you use the service. service. Free / \$ 27.99 a year is one of the best apps for the best to do on your mobile. It has a simple user interface, lots of organization and customization options and most of its features are completely free. It uses a list style with simple controls. You can use it to remember your work activities or your list of foodstuffs. You can also share lists with friends or family to collaboration. It also includes reminders (up to two per task) for free, unlike many lists listing to do. Ticktick is flexible so. The app also has a number of widget options. This includes a minimal widget and widget, but functional specifically for your activities lists. You can also order tasks for things like the due date. The version subscription of \$ 27.9999 per year is not necessary if you don't really need more than two reminders per event. Joe Authority Hindy / Android Price: free / up to \$ 2.99 times until you are a little funny app with some small decent widgets. It is an application of the countdown. You use it for things like holidays, birthdays, special events or whatever you need a countdown to. You can put it down to the second, minute, now, day, week or month. It also takes business days in à é
