States are independent if the knowledge of a state does not provide information about the state of the other. If states are entangled, information about one improves our knowledge of the other. The quitian entanglement is the same phenomenon of the lack of independence. However, in the quitical theory, a quaint state is described by mathematical objects called waveforms. Moleps are subsystems, namely Elém and Numes. In his lower state of energy, a molemplate is in a highly tangle of these nuclei and electron, because the positions of the constituent particles are not independent; The Elérons moves with the nuclei. According to Wired, the founder of Quitica Theory was Erwin SchrĶdinger that was also the inventor of the Schrödinger cat, with contributions from Boris Podolsky, Niels Bohr, and Nathan Rosen, as well as Daniel Greenberger Michael Horne and Anton Zeilinger. In the last years, Navalny, Maldacena and Leonard Susskin of Stanford have an example of proposal on the guarry entanglement. Phansical Albert.
