"Synthetic" has become a dirty word in the beauty market more and more naturally inclined. In recent years, printing has largely supported consumers from ingredients such as artificial and sulphate fragrances and to formulas that are more "natural". Although, as we explained that it surrounds this topic before, this word does not actually mean much, since there are no industry level requirements for what constitutes a "natural" beauty product. The sulphates in particular were victims of a particularly ugly campaign - so that is justified? To clarify the pros, cons and potential risks of using hair products with sulphates and artificial fragrances once and for all, we have consulted a duo of experts of hair dryer and dermatologists Dr. Michele Farber of Schweiger Dermatology Group in New York and Dr. Y. Claire Chang, a cosmetic dermatologist certified by edge to Union Square Laser Dermatology in Manhattan, who together provided a balanced view. Read on to learn the truth about what the sulphates are and if they are really so bad for you (plus, 411 on the ingredients of synthetic hair dryer in general). Meet the Dr. Michelle Farber expert, MD, FAAD is a dermatologist certified by the edge that practices the Schweiger dermatology group in New York City. Meet the experienced Dr. Y. Claire Chang is a dermatologist certified by border and a beauty and a skincare expert at the Union Square Laser Dermatology in New York City. I know dozens of beauty obsessive that they will not even touch a hair product that contains sulphates. Once I heard a beauty publisher raised to the word, as if I could hear after hearing someone I tell you that they use a tanning bed. In fact, some people think they are just as dangerous: at the end of the 1990s, the information started to circulate in the media that some of the chemicals found in the shampoo, including sulphates and fragrances made in the laboratory, could potentially cause cancer. Since then, many consumers have become particularly wary of anything synthetic - sulfates included. But the difference between, for example, sulphates and the use of the tanning bed is that the study after the study revealed that submitting your skin to UV rays increases your risk of cancer (according to the American Academy of Dermatology, Using tanning beds before 35 years can increase your probability of 59 percent melanoma) .À Á »ÀÁÀ Á» By contrast, most of the precautions that we feel synthetic found in hair products are actually Feel, according to scientific studies. Á »ÀÁÀÁ» Á» Non not to say there are not toxic synthetics, it's just that sulphates are not exactly one of them. But what exactly are they? Chang has the answer: "The sulphates include a Group of synthetic ingredients found in many personal care products, such as body washes, facial detergents, shampoos and toothpaste. Sulphates include sodium lauryl sulphate, ammonium sulphate laurety sulfate and sodium laureth sulfate. "Although she recognizes that there was a bit of hype around sulphates who had carcinogenic effects, he continues to say that" there is no no no Confirm that sulphates cause long-term damage when used in skin care or hair care products. The authorities, including the FDA and the American Cancer Society, consider Safe sulfates to use in cosmetics and personal care products and do not consider it a carcinogen. "StockSy / Design by Camden Dechert sulfates are probably the most controversial synthetic ingredient for Consumers naturally mind, but before writing them as evil, it is worth clarifying what exactly they are. "The sulphates are the responsible detergents of the Super-Sudsy lather that goes out of most shampoos," explains Michelle Cleveland. The sulfates are in fact the first most common ingredient that is in hair care products even today, and you know that you meet them when you see names like sodium flood sulphate, sodium lauril sulphate, and ammonium bay sulfate on a 'Ingredient label. Meet the expert Michelle Cleveland is a celebrity hairstylist, extension artist and educator. It is also the owner of Hair Addict Salon in Toms Ri Ver, New Jersey. In terms of chemistry, sulphates are a type of ingredient called a surfactant, which is a combination of molecules that attracts water and oil. "This unique property allows soaps, shampoos and body washes to separate dirt and oil from the skin or hair and then allow water that rinse with to take it out of the body and down to drain", Chemist Kevin Ewell said Xojane. Meet the experienced Kevin Ewell is a cosmetic research and development chemist. He is currently vice president of the product innovation at Ritual and is located in Los Angeles, again, there is absolutely no proof that sulphates cause cancer or other health problems. When used as a direct (It means, you use to wash your hair in the shower or in the bathroom and not to ingest, for example), are 100% secure. But only because a product is safe for your health it doesn't mean that it does not irritate. Dr. Farber shares: "Ilfati can irritate sensitive skin, especially the skin around the eyes and face skin. They can also cause acne around the hairline when found in shampoo." Chang, in the same way, worries about skin health: "Ilfati that are used in facial detergents and body washes must be applied and rinsed completely. I recommend using moisturizers together with products containing sulfate, as they can cause dryness." The sulfates are so effective to remove the dirt from the hair that sometimes crawl the hair of its natural oils and the proteins that make it seem polished and healthy. Furthermore, if a product containing sulfate gets in the eye, it can prick, and Cleveland says sulphates can also cause early fading of hair color and keratin services. Chang suggests you To your colorist if you're sure your particular color uses a shampoo with or without sulphates. Also, if you have super sensitive skin, the combination of sulphates and synthetic fragrance can cause a rash. TAWNI BANNISTER FOR BYRDIE "If you are not sensitive, sulphates can be useful in A deep clean in washes and shampoo, "says Farber." Follow your bad areas and less sensitive-armpits, groin and feet ". He continues, " they are not dangerous unless your skin is sensitive, but without sulphate the products are sweets. In general, sulphates are prevalent in skin care products and are good in those who do not have a delicate skin until they are used correctly. "À Ć œ À¿Á¿Á¿Á¿" All shampoo strip the hair of natural oil. This is the way they cleaned, "says Ewell." If you are worried about losing the natural oils of your hair, the only thing you can do is stop washing your hair. But I wouldn't be too attached to your natural oils, because capturing dirt, pollen and pollution, which surely don't want to our hair. "In the end, washing the hair with a shampoo of any kind and subsequent a conditioner will keep the hair clean and hydrated ... That's why it has become the standard routine of most consumers of hairdryer. Ultimately, says Ewell, sulphates "They often take the bad press and the natural crowd hates them, but they are perfectly refined ingredients." However, this does not mean that sulphates are good for your hair - natural oils that your hair has served the purpose of protecting trees of your daily wear. As with most things, if you use a shampoo with sulphates, you just need to do it in moderation. "If abuse, left too long, or used to rub the skin, the sulphates crawl oil And they lead to irritation ", Farber actions. On that note, " Synthetic "does not have to be a dirty word even". For example, if there is an animal-Deri ingredient of VED with exceptional advantages for your C Apelli, some companies choose to recreate that ingredient in the laboratory rather than focusing it directly from the animals, "explains Cleveland. Not to mention, artificial fragrances (which, again, are not dangerous for your health) will not cause any irritation unless you have a super sensitive skin.
