Install Android Emulators On Windows Server 2016 As promised earlier, I will show you how two different Android emulators can be used on a VPS without any GPU running Windows Server 2016. Without further ado, let's get started! 1) BlueStacks 3 BlueStacks is one of the most popular Android emulator used by millions of users. Due to its popularity, it is first on the list. However, the latest version of BlueStacks i.e. 4 requires far more resources and will not work on our VPS. Therefore, we will be installing the older version instead. Step 1: Download and Install BlueStacks In the first step, we need to log into our remote Windows Server 2016 and download the setup file for BlueStacks 3. Once the setup is downloaded, double click on the setup to run the installer. Click on 'Install Now' to initiate the process. It will first extract the files and then the engine. This process can take several minutes depending upon your VPS resources. Half-way through the installation, a welcome screen prompts, you may close this screen to proceed with the rest of the process. Once the installation is completed, you will be asked to allow location access. At this point, you may either agree or disagree. We have successfully installed BlueStacks, the next step we need to configure it before actually using it. Step 2: Configure and Run BlueStacks Just like any Android device, BlueStacks also require you to log into your Gmail account. After selecting the desired language, follow through the process, and log in with your Gmail ID to access PlayStore. After signing in, BlueStacks will ask for permissions like backing up data to Google account and accessing the location. At the end of the process, define your device name. At this point, we have successfully installed and configured our Android emulator. To test the emulator, let's go ahead and download an application from Google PlayStore. For the demo, I will install YouTube application from the PlayStore. Voila! YouTube has launched successfully. You can now install your favorite application or test the ones you are developing using BlueStacks Android emulator on your VPS. 2) SmartGaGa SmartGaGa is another Android emulator that can be used on a Windows Server 2016. Simply download the setup file and run it for installation. Once the download is completed, click on 'Install Now' to initiate the installation process. When the installation is completed, click on the 'Finish' button to launch the emulator. It is a lightweight emulator for took only a few seconds to boot up. The rest of the process remains the same, sign in with your Gmail ID to access PlayStore. I am already signed in, let's go ahead and download our first application. This time I will download WhatsApp directly from the PlayStore. WhatsApp app is successfully installed on our Android emulator.
