Oracle hyperion interactive reporting studio. Oracle hyperion interactive reporting.

Scripting on this page enhances content navigation, but does not change the content in any way. Page 2 continue statements can be used to restart while, do...while, for, and label statements. Forwhile and for, continue terminates the current loop and continues execution of the loop with the next iteration For while, continue returns to the condition For for, continue moves to the increment expression For label, continue restarts the statement or continues execution of a labeled loop with the next iteration. The continue statement must be in a looping statement that is identified by the label that continue uses. Note: In contrast to the break statement, continue does not entirely terminate the execution of the loop. continue statement syntax: continue or continue [label] Example—A while loop with a continue statement that executes when the value of i is 3. Thus, n obtains the values 1, 3, 7, and 12. Example—A statement labeled checkiandj that contains a statement labeled checkj: If continue is encountered, the current iteration of checkj terminates, and the next iteration of checkj begins. Iterations continue until the checkj condition returns false. When false is returned, the remainder of checkiandj is complete and checkiandj reiterates until its condition returns false. When false is returned, the statement following checkiandj executes. If continue had a label of checkiandj, checkiandj would re-execute. Get full access to The Business Analyst's Guide to Oracle Hyperion Interactive Reporting 11 and 60K+ other titles, with free 10-day trial of O'Reilly. There's also live online events, interactive content, certification prep materials, and more. Quickly master this extremely robust and powerful Hyperion business intelligence toolGet to grips with the most important, frequently used, and advanced features of Oracle Hyperion Interactive Reporting 11A step-by-step Oracle Hyperion training guide packed with screenshots and clear explanationsExplore the features of Hyperion dashboards, reports, pivots, and chartsLearn how to build advanced data models and queries, and how to import external data set into your analysisIn DetailOracle Hyperion Interactive Reporting is one of the many products in the Oracle Enterprise Performance Management software suite, an industry-leading business intelligence software package. The primary focus of the Interactive Reporting product is to provide strong relational querying and data analysis capabilities. It also provides the capability to disseminate information throughout an enterprise. There is a very steep learning curve for most users of this tool.This book examines the power of the Interactive Reporting Web Client software, focusing on the key features of each section of the product. The author's experience in developing and supporting Interactive Reporting users is very well documented in this book. The goal is to educate you on every useful feature of the product, enabling you to gather information from various sources and process it to produce meaningful results that help you to spot problems and analyze trends necessary for business decisions.The book starts with a quick introduction to the product interface and the EPM Workspace, with explanation of importing and provisioning. It then takes you through each section from building a query and data model to building graphical displays of the data in a logical sequence. The report sections and interactive dashboards are also discussed at length. The book also covers advanced features of the product and provides you with the information necessary to build the foundation for creating complex queries and computations using the product.Demonstrates the key functionalities of the Oracle Hyperion Interactive Reporting software with a detailed view of each section and an introduction to dashboard design 182/232 Use the Services section in EPM Workspace (select Navigate, then Administer, then Reporting and Analysis, and then Services) to configure the Hyperion Interactive Reporting Data Access Service so the service references the database system that contains the Reporting and Analysis repository tables. The configuration must match the way that business reporting data sources are configured. For example, if the repository is implemented using MS SQL Server, the Hyperion Interactive Reporting Data Access Service configuration is displayed in the Add Data Source to DAS screen with the parameters: Connectivity Type: ODBC Database Type: MS SQL Server Select the name of the data source: metadata Note: The data source name is metadata, as created in the ODBC configuration, and references the database instance in MS SQL Server. Scripting on this page enhances content navigation, but does not change the content in any way. Page 2 This step enables you to set filters that are available for each dashboard section. The filters are available in the Filters drop-down list on the top panel of the dashboard. Note: Lite frame prototypes cannot directly access the Filter dialog box, so frames created from Lite frames are excluded from the list. To configure filters: In Step 6: Configure Filters from Select a Frame, select one or more frames. Optional: To add or remove filters from the dashboard, use the Configuration drop-down list to move to QIQ Filter Properties, and click to refresh settings. Select Available Filters to be available in the selected dashboard sections. Available Filters only displays filters created before arriving at Step 6 of Dashboard Studio. Note: Filter names that start with _sys (or with sys for pre-3.2 Release templates) are ignored by the filters feature of Dashboard Studio and are not altered in any way. Move selected filters between Available Filters and Active Filters by clicking and , or move all filters by clicking and , or double-click a filter. Optional: Reorder Active Filters, by selecting a filter and clicking or . Click to apply the selections to the document. Click to move to the next step. Step 7: Configure Properties is displayed. Filter Usage and Sections where used indicates what is represented by the currently selected filter. For example, if selected filters are in Revenue Results, filters that share a name and data type are treated as one filter. A combined set of filters is presented, and the selected values are distributed to all results with filters. Caution! If a column is displayed in multiple tables or results with an identical name but conflicting data types, unexpected behavior may result in the dashboard. Such columns must be renamed so that each column of each filter contains matching data types. Training Objectives of Hyperion Interactive Report: The main Objective of this Course is to providing a complete overview of the Interactive Reporting Web Client and EPM Workspace, providing the business analyst with the skills necessary to work with the tool on a daily basis. At End of the Completion of the Course, students must be able to create queries against a relational data source and create reports with Hyperion Interactive Reporting Studio and they will learn the concepts of request items filter and sort data and process queries. Target Students / Prerequisites: Students must have Basic knowledge of data warehouse and database concepts and familiar to write SQL queries on multiple database objects and Basic knowledge of Javascript Required.
