Excel vlookup several sheets. How to vlookup across multiple sheets in excel with examples. How to create a vlookup across multiple sheets. How to do a vlookup with multiple spreadsheets. How to use vlookup in excel with multiple sheets.

Microsoft Excel's Vlookup formula permits you to search large spreadsheets for specific data, one of Excel's lookup and reference functions. You can use Vlookup between sheets within an Excel workbook, as well as within a single sheet. The Vlookup formula essentially processes four pieces of information to perform the search. Programming the Vlookup function uses the value you want to look up, the spreadsheet range in which to look, the column within that range containing the value and whether you want an exact or approximate match for the value. Vlookup permits you to extract data from an Excel spreadsheet in very flexible and powerful ways. Vlookup in Excel contains four parameters, called arguments, which are filled by you as part of the function formula. The syntax of Vlookup looks like this: =VLOOKUP(lookup_value, table_array, col_index_num, [range_lookup])

lookup_value: this is the value for which you're searching in the spreadsheet. If you were looking for the number of people in a directory named Laura, the lookup value would be entered as a text string, "Laura" including the quotation marks. Numerical values don't need quotes. table_array: this is the range of cells within which you're looking for the data. For example, if people's names are in three columns from B to D, and there are 300 rows of data, you'd enter the range B1:D300, assuming data started on the first row. col_index_num: refers to the column within the table array in which to find the lookup value. In this example, column D is numerically the third column, so the index number is 3. [range_lookup]: this optional parameter returns approximate matches if the range_lookup value is TRUE, and returns only exact matches if the range_lookup is FALSE. Omitting this parameter assumes a value of TRUE. The formula for a Vlookup in Excel cell for this example would be: =VLOOKUP("Laura", B2:D300,3,FALSE) This looks up all exact matches for people named Laura. Looking up data on a single sheet is usually not very difficult, so Vlookup may have limited use on simple spreadsheets. However, when you have a multi-sheet workbook encompassing lots of data, you may want to create a summary sheet to extract data from an Excel workbook. All that's needed to accomplish this is, to add sheet information into the second argument. Say, for example, that names in the directory are on Sheet2. Add the target sheet name before the cell reference in the table array, separated by an exclamation mark. This makes the Vlookup formula reference the cell range on another sheet. For the example, the function formula would now be: =VLOOKUP("Laura", SHEET2!B2:D300,3,FALSE) Regardless of which sheet the Vlookup formula is on, the formula now references data on Sheet 2. You can also do lookups in other Excel workbooks by adding the workbook folder and file name in square brackets before the sheet name. If you want to use VLOOKUP across several worksheets in Excel, you can accomplish this by using the Consolidate feature as well as certain features of the VLOOKUP function itself. Generally, you can use it to look up one sheet at a time. However, modifying the data allows us to use VLOOKUP across multiple sheets in Excel. In the following example, we have the sales record of beverages in three different states for the 1st quarter of the year 2018. The workbook contains three sheets of data for sales during the 1st quarter of the year. There are three items: Lemonade, Orange Juice, and Pina Colada. The data contains the sale records for these items during the months January, February, and March. It represents the sales for three states, PH, TX and ID in the same cells B2:F5 for all three worksheets. If you want to calculate the percent of individual items for any three months of the 1st quarter, you would need to extract the values with VLOOKUP and sum them. But VLOOKUP won't work here as the sales records are laid out over multiple worksheets. In this tutorial, we will show you how to use VLOOKUP when the data for table array is spread over multiple sheets. You will find the percentage of total sales for Orange Juice sales during the month February. Using VLOOKUP with reference data on multiple sheets To use VLOOKUP with referenced data on multiple sheets, you will first consolidate the data on a master sheet. Then on the master sheet, a VLOOKUP formula will help to perform the correct calculation. For this to work you would need to follow the steps below:

Create a new worksheet named "Qtr. 1 Overall" using the "+" icon on the bottom. Click on the cell where you want the consolidated data to begin. For consistency with the previous cells, you want this cell to be B2. Select B2 by clicking on it. Now, click Data > Consolidate. In the Function box, select the function SUM. In the reference box, first click on the "Qtr. 1 PH" sheet and select cells B2:F5 dragging them with your mouse. Click Add. Click on the "Qtr. 1 TX" sheet. At this point, Excel will automatically have the cells B2:F5 selected. If not, select cells B2:F5 and click Add. Repeat the same process for sheet "Qtr. 1 ID". Click the "Top Row" and "Left Column" checkboxes. If you want the consolidated data to be updated automatically every time the sales sheets updates, click on the "Create links to source data" box. Click OK. Excel will fill up the newly created worksheet with the sum of all items for the corresponding months. Now, you will make two more changes to the sheet. To add the changes perform the following steps: In cells B9 and C9 add the headers "Item Name" and "Month". These will be the values returned by VLOOKUP. Add the header "Total" in cell D9. This would be the total calculated by consolidation and returned by VLOOKUP. In cells B10 and C10, add the name and month "Orange Juice" and "Feb." On cell D10 insert the formula "=VLOOKUP(B10,\$B\$3:\$F\$5,2,FALSE)/VLOOKUP(B10,\$B\$3:\$F\$5,5)" Select cell D10, format it as "percentage." To do this click home > % (On the Number section in the middle). This will return 34% as the percent of total sales for "Orange Juice" for the month of February over the three states. If you have trouble with using VLOOKUP and want to save hours of researching, try our Excel Chat live help service. Our experts are available 24/7 and ready to answer any Excel related question on the spot. The first question is free. Are you still looking for help with the VLOOKUP function? View our comprehensive round-up of VLOOKUP function tutorials here. This tutorial will demonstrate how to perform a VLOOKUP on multiple sheets in Excel and Google Sheets. If your version of Excel supports XLOOKUP, we recommend using XLOOKUP instead. The VLOOKUP Function can only perform a lookup on a single set of data. If we want to perform a lookup among multiple sets of data that are stored in different sheets, we can either combine all sets of data into one set or use the IFERROR Function together with VLOOKUP to perform multiple lookups in a single formula. The latter method is simpler in Excel while the former is simpler in Google Sheets. VLOOKUP with IFERROR The VLOOKUP Function (and other lookup formulas) returns an error if it can't find a match, and we normally use the IFERROR Function to replace the error with a customized value. Instead of a customized value, we'll use the IFERROR to perform another VLOOKUP from another sheet if the first VLOOKUP can't find a match in the first sheet. VLOOKUP - 2 Sheets at Once =IFERROR(VLOOKUP(B3,'Department A'!\$B\$3:\$C\$7,2,FALSE),VLOOKUP(B3,'Department B'!\$B\$3:\$C\$7,2,FALSE)) Let's walk through the formula: VLOOKUP Function Here's the first VLOOKUP: =VLOOKUP(B3,'Dept. A'!\$B\$3:\$C\$7,2,FALSE) Note: The VLOOKUP Function searches for the lookup value from the first column of the table and returns the corresponding value from the column defined by the column index (i.e., 3rd argument). The last argument defines the type of match (i.e., True - Approximate Match, False - Exact Match). Here's the VLOOKUP for the 2nd Sheet: =VLOOKUP(B3,'Dept. B'!\$B\$3:\$C\$7,2,FALSE) IFERROR Function We combined the results of the 2 VLOOKUPs using the IFERROR Function. We check the value of the first VLOOKUP (e.g., Department A). If a value is an error, the corresponding value from the 2nd VLOOKUP is returned instead. =IFERROR(E3,F3) Note: The IFERROR Function checks a value (i.e., 1st argument) if it's an error (e.g., #N/A, #REF!). If it's an error, then it will return the value from its last argument instead of the error. If it's not an error, it will return the value that is being checked. Combining all these concepts results to our original formula: =IFERROR(VLOOKUP(B3,'Department A'!\$B\$3:\$C\$7,2,FALSE),VLOOKUP(B3,'Department B'!\$B\$3:\$C\$7,2,FALSE)) For more than two sheets, we need to add one VLOOKUP and one IFERROR per additional sheet to the formula above. Here's the formula for 3 sheets: =IFERROR(VLOOKUP(B3,'Dept. A'!\$B\$3:\$C\$7,2,FALSE),VLOOKUP(B3,'Dept. B'!\$B\$3:\$C\$7,2,FALSE),VLOOKUP(B3,'Dept. C'!\$B\$3:\$C\$7,2,FALSE)) VLOOKUP Multiple Sheets at Once in Google Sheets Although the combination of IFERROR and VLOOKUP works the same way in Google Sheets, it's simpler to combine the data sets into one. VLOOKUP with Curly Brackets {} (Google Sheets) We can combine the data sets into one using the curly brackets. =VLOOKUP(B3,{'Department A'!\$B\$3:\$C\$7;'Department B'!\$B\$3:\$C\$7;'Department C'!\$B\$3:\$C\$7},2,FALSE) Let's breakdown and visualize the formula: Stack all data sets vertically by separating the ranges of cells using the semi-colon inside the curly brackets:={'Department A'!\$B\$3:\$C\$7;'Department B'!\$B\$3:\$C\$7;'Department C'!\$B\$3:\$C\$7} Note: The curly brackets in Google Sheets can also be used to create an array from ranges of cells. The semi-colon is used to stack values vertically while the comma is used to stack values horizontally. If the ranges of cells will be stacked vertically, we need to make sure that the no. of columns for each of the ranges of cells is the same. Otherwise, it won't work. For horizontal, the no. of rows must be the same. The resulting array is used as the input for the 2nd argument of the VLOOKUP: =VLOOKUP(E3,\$B\$3:\$C\$17,2,FALSE) Combining all these together results to our original formula: =VLOOKUP(B3,{'Department A'!\$B\$3:\$C\$7;'Department B'!\$B\$3:\$C\$7;'Department C'!\$B\$3:\$C\$7},2,FALSE)
